Suggested Reviewers

Manuscript: Is Wireless Security Ready for the AI Era? Evidence from a Curated Corpus of 130 Studies, 2020–2026

The researchers below work on machine learning for wireless communications and security, the subject area of this submission, and are suggested for their domain fit. No contact details are supplied in this document: verify each reviewer's current email address and affiliation from institutional pages or recent publications before entering them in the submission system, and do not include anyone with a recent collaboration, co-authorship, or same-institution relationship with the authors. If the journal requires a minimum or maximum number of suggested reviewers, follow its current instructions to authors.

Name	Affiliation	Research focus	Suggested because
Walid Saad	Virginia Tech, USA	Wireless network security; game theory; ML for wireless systems	Long-standing work on the security of AI-enabled wireless and autonomous networks
Rose Qingyang Hu	Utah State University, USA	AI/ML for wireless networks; network security	Bridges communications engineering and AI, matching the corpus's defense and threat tracks
Miao Pan	University of Houston, USA	Wireless security; federated and privacy-preserving learning	Covers federated-privacy and authentication strands represented in the corpus
Francesca Restuccia	Northeastern University, USA	RF fingerprinting; adversarial ML over the wireless channel	Directly relevant to the authentication/RF-fingerprinting focus (69 of 121 core studies)
Yalin Evan Sagduyu	Johns Hopkins University Applied Physics Laboratory, USA	Adversarial ML; AI security for tactical wireless networks	Attack-side expertise matching the threat-track validation findings
Neetesh Saxena	Cardiff University, UK	Wireless and mobile security; authentication protocols	Authentication-protocol perspective complementing the physical-layer focus

Affiliations are given as commonly listed and should be confirmed during verification. The submission system also allows opposing reviewers to be named if the authors wish to exclude specific individuals for legitimate reasons.
